**Problems: 3-1.2, 3-1.3(b), 3-2.1, 3-2.2, 3-2.3, 3-2.4, 3-3.1, 3-3.3**

**3-1.2**

a) In this problem our joint pdf is:

$$f_{XY}(x, y) = \begin{cases} kxy & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

To determine the value  $k$ , we need the following condition:

$$\iint f_{XY}(x, y) dx dy = 1.$$

Or, set

$$k \int_0^1 x dx \int_0^1 y dy = 1$$

and from this condition above we find

$$k = 4$$

The joint pdf is therefore:

$$f_{XY}(x, y) = \begin{cases} 4xy & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

b) To determine the cdf  $F_{XY}(x, y)$ , we use the following equation:

$$F_{XY}(x, y) = \int_{-\infty}^x \int_{-\infty}^y f_{XY}(u, v) du dv$$

We find the cdf as the following:

$$\begin{aligned} F_{XY}(x, y) &= \int_{-\infty}^x \int_{-\infty}^y f_{XY}(u, v) du dv \\ &= \begin{cases} \int_0^x \int_0^y 4uv du dv & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ \int_0^1 \int_0^x 4uv du dv & 0 \leq y \leq 1, x > 1 \\ \int_0^x \int_0^1 4uv du dv & 0 \leq x \leq 1, y > 1 \\ \begin{cases} 1 & x > 1, y > 1 \\ 0 & \text{otherwise} \end{cases} \end{cases} \\ &= \begin{cases} x^2 y^2 & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ y^2 & 0 \leq y \leq 1, x > 1 \\ x^2 & 0 \leq x \leq 1, y > 1 \\ \begin{cases} 1 & x > 1, y > 1 \\ 0 & \text{otherwise} \end{cases} \end{cases} \end{aligned}$$

c) We formulate the probability as the following:

$$P\left\{X \leq \frac{1}{2}, Y > \frac{1}{2}\right\} = F_{XY}\left(\frac{1}{2}, 1\right) - F_{XY}\left(\frac{1}{2}, \frac{1}{2}\right) = \left(\frac{1}{2}\right)^2 1^2 - \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^2 = \frac{3}{16} = 0.1875$$

d) The marginal density function  $f_X(x)$  is

$$f_X(x) = \int_{-\infty}^{\infty} f_{XY}(x, y) dy = \begin{cases} \int_{-\infty}^{\infty} f_{XY}(x, y) dy & 0 \leq x \leq 1 \\ 0 & \text{otherwise} \end{cases} = \begin{cases} \int_0^1 4xy dy & 0 \leq x \leq 1 \\ 0 & \text{otherwise} \end{cases}$$

$$= \begin{cases} 2x & 0 \leq x \leq 1 \\ 0 & \text{otherwise} \end{cases}$$

### 3-1.3 (b)

For the random variables of Problem 3-1.2, the expected value of the product of X and Y is

$$E[XY] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy f_{XY}(x, y) dx dy = \int_0^1 \int_0^1 xy 4xy dx dy = \frac{4}{9}$$

### 3-2.1

- a) Since the signal X is Rayleigh distributed, we know the pdf of X as

$$f_X(x) = \begin{cases} \frac{x}{\sigma_X^2} \exp\left(-\frac{x^2}{2\sigma_X^2}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

Since the mean value of X is 10, according to the page 80, we have

$$\bar{X} = \sqrt{\frac{\pi}{2}} \sigma_X = 10$$

So, we know that

$$\sigma_X = 10 \sqrt{\frac{2}{\pi}}, \quad \sigma_X^2 = \frac{200}{\pi}$$

The pdf of signal X is

$$f_X(x) = \begin{cases} \frac{x}{200/\pi} \exp\left(-\frac{x^2}{400/\pi}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

Now, the noise N is uniformly distributed, it is straightforward to find the pdf of N as

$$f_N(n) = \begin{cases} \frac{1}{12} & -6 \leq n \leq 6 \\ 0 & \text{otherwise} \end{cases}$$

We also know that X and N are statistically independent and we have the observation

$$Y = X + N$$

Since we know that the conditional pdf

$$f_{X|Y}(x|y) = \frac{f_{XY}(x, y)}{f_Y(y)} = \frac{f_{Y|X}(y|x) f_X(x)}{f_Y(y)}$$

Now, since  $N = Y - X$ ,

$$f_{Y|X}(y|x) = f_N(n = y - x) = f_N(y - x)$$

Thus, we can write the conditional pdf  $f_{X|Y}(x|y)$  as the following:

$$f_{X|Y}(x|y) = \frac{f_{Y|X}(y|x) f_X(x)}{f_Y(y)} = \frac{f_N(y - x) f_X(x)}{f_Y(y)} = \frac{f_N(y - x) f_X(x)}{\int_{-\infty}^{\infty} f_{XY}(x, y) dx} = \frac{f_N(y - x) f_X(x)}{\int_{-\infty}^{\infty} f_N(y - x) f_X(x) dx}$$

Note that in our case,

$$\begin{aligned} -6 &\leq n \leq 6 \\ -6 &\leq y - x \leq 6 \end{aligned}$$

$$\begin{aligned} -6 \leq x - y \leq 6 \\ -6 + y \leq x \leq 6 + y \end{aligned}$$

The limits for x should be reflected in the integration  $\int_{-\infty}^{\infty} f_N(y-x)f_X(x) dx$ , so we can write the conditional pdf  $f_{X|Y}(x|y)$  as the following:

$$\begin{aligned} f_{X|Y}(x|y) &= \begin{cases} \frac{f_N(y-x)f_X(x)}{\int_{-6+y}^{6+y} f_N(y-x)f_X(x) dx} & -6+y \geq 0 \\ \frac{f_N(y-x)f_X(x)}{\int_0^{6+y} f_N(y-x)f_X(x) dx} & -6+y < 0 \end{cases} \\ &= \begin{cases} \frac{(1/12)f_X(x)}{(1/12) \int_{-6+y}^{6+y} f_X(x) dx} & -6+y \geq 0 \\ \frac{(1/12)f_X(x)}{(1/12) \int_0^{6+y} f_X(x) dx} & -6+y < 0 \end{cases} \\ &= \begin{cases} \frac{f_X(x)}{\int_{-6+y}^{6+y} f_X(x) dx} & -6+y \geq 0 \\ \frac{f_X(x)}{\int_0^{6+y} f_X(x) dx} & -6+y < 0 \end{cases} \end{aligned}$$

For the case when  $y=0$ ,

$$\begin{aligned} f_{X|Y}(x|y=0) &= \frac{f_X(x)}{\int_0^{6+y} f_X(x) dx} = \frac{f_X(x)}{\int_0^6 f_X(x) dx} \\ &= \begin{cases} \frac{\frac{x}{200/\pi} \exp\left(-\frac{x^2}{400/\pi}\right)}{\int_0^6 \frac{x}{200/\pi} \exp\left(-\frac{x^2}{400/\pi}\right) dx} & x \geq 0 \\ 0 & \text{otherwise} \end{cases} \\ &= \begin{cases} \frac{\frac{x}{200/\pi} \exp\left(-\frac{x^2}{400/\pi}\right)}{0.2463} & x \geq 0 \\ 0 & \text{otherwise} \end{cases} \end{aligned}$$

Now,

$$f_{X|Y}(x|y=0) = \begin{cases} \frac{x}{15.68} \exp\left(-\frac{x^2}{400/\pi}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

For the case when  $y=6$ ,

$$f_{X|Y}(x|y=6) = \frac{f_X(x)}{\int_{-6+y}^{6+y} f_X(x) dx} = \frac{f_X(x)}{\int_0^{12} f_X(x) dx} = \begin{cases} \frac{x}{43.12} \exp\left(-\frac{x^2}{400/\pi}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

For the case when  $y=12$ ,

$$f_{X|Y}(x|y=12) = \frac{f_X(x)}{\int_{-6+y}^{6+y} f_X(x) dx} = \frac{f_X(x)}{\int_6^{18} f_X(x) dx} = \begin{cases} \frac{x}{42.99} \exp\left(-\frac{x^2}{400/\pi}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

b) If the observation yields a value of  $y = 12$ , we know from Part 1 that

$$f_{X|Y}(x|y=12) = \begin{cases} \frac{x}{42.99} \exp\left(-\frac{x^2}{400/\pi}\right) & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

According to the book on page 127, the value of  $x$  for which  $f_{X|Y}(x|y=12)$  is a maximum is a good estimate for the true value of  $X$ . So the value of  $x$  can be determined by equating the derivative (with respect to  $x$ ) of the conditional pdf to zero:

$$\frac{df_{X|Y}(x|y=12)}{dx} = 0$$

Or,

$$\frac{d}{dx} \frac{x}{42.99} \exp\left(-\frac{x^2}{400/\pi}\right) = 0$$

We find the solution as

$$x = 10 \sqrt{\frac{2}{\pi}} = \sigma_x$$

### 3-2.2

- a) The joint pdf of  $X$  and  $Y$  in problem 3-1.2 is

$$f_{XY}(x, y) = \begin{cases} 4xy & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

To find the conditional pdf  $f_{X|Y}(x|y)$  we do the following.

Since

$$f_{X|Y}(x|y) = \frac{f_{XY}(x, y)}{f_Y(y)}$$

We need to find  $f_Y(y)$  first:

$$f_Y(y) = \int_{-\infty}^{\infty} f_{XY}(x, y) dx = \int_0^1 4xy dx = 2y, \quad 0 \leq y \leq 1$$

So now,

$$f_{X|Y}(x|y) = \frac{f_{XY}(x, y)}{f_Y(y)} = \begin{cases} \frac{4xy}{2y} & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_{X|Y}(x|y) = \begin{cases} 2x & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

- b) By noticing that we can change  $x$  to  $y$ , and  $y$  to  $x$  in the joint pdf of  $X$  and  $Y$ , we get the result as

$$f_{Y|X}(y|x) = \begin{cases} 2y & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

### 3-2.3

A dc signal  $X$  has a uniform distribution over the range of  $-5V$  to  $+5V$ , then the pdf for r.v.  $X$  is

$$f_X(x) = \begin{cases} \frac{1}{10} & -5 \leq x \leq 5 \\ 0 & \text{otherwise} \end{cases}$$

Since the noise  $N$  is a Gaussian distributed with zero mean and variance of  $2V^2$ , we know the pdf for r.v.  $N$  is

$$f_N(n) = \frac{1}{\sqrt{2\pi}\sigma_N} \exp\left[\frac{-n^2}{2\sigma_N^2}\right], \quad -\infty < n < \infty$$

Where  $\sigma_N^2 = 2$ .

- a) Now, our observation is  $Y = X + N$ . The conditional pdf of the signal  $x$  given the value of measurement  $y$   $f_{X|Y}(x|y)$  is

$$\begin{aligned} f_{X|Y}(x|y) &= \frac{f_{XY}(x, y)}{f_Y(y)} = \frac{f_{Y|X}(y|x)f_X(x)}{f_Y(y)} = \frac{f_N(y-x)f_X(x)}{f_Y(y)} = \frac{f_N(y-x)f_X(x)}{\int_{-\infty}^{\infty} f_{XY}(x, y) dx} \\ &= \frac{f_N(y-x)f_X(x)}{\int_{-\infty}^{\infty} f_N(y-x)f_X(x) dx} \\ &= \begin{cases} \frac{\frac{1}{\sqrt{2\pi}\sigma_N} \exp\left[\frac{-(y-x)^2}{2\sigma_N^2}\right] (1/10)}{\int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}\sigma_N} \exp\left[\frac{-(y-x)^2}{2\sigma_N^2}\right] (1/10) dx} & -5 \leq x \leq 5 \\ 0 & \text{elsewhere} \end{cases} \end{aligned}$$

So,

$$f_{X|Y}(x|y) = \begin{cases} \frac{\exp\left[\frac{-(x-y)^2}{2\sigma_N^2}\right]}{\int_{-5}^5 \exp\left[\frac{-(x-y)^2}{2\sigma_N^2}\right] dx} & -5 \leq x \leq 5 \\ 0 & \text{elsewhere} \end{cases}$$

- b) When we have a measurement value 6 ( $X + N = Y = 6$ ),

$$f_{X|Y}(x|y=6) = \begin{cases} \frac{\exp\left[\frac{-(x-6)^2}{2\sigma_N^2}\right]}{\int_{-5}^5 \exp\left[\frac{-(x-6)^2}{2\sigma_N^2}\right] dx} & -5 \leq x \leq 5 \\ 0 & \text{elsewhere} \end{cases}$$

The best estimate of  $x$  is 5 (and not 6; sketch and verify this), because we have a constraint that  $-5 \leq x \leq 5$ .

- c) Same as part b) the best estimate of  $x$  is 5 V (also sketch and verify this).

### 3-2.4

- a) The observation  $Y = X + N$ , where  $X$  is the random signal and  $N$  is the noise, we know the signal and the noise are independent. From the results we found in problem 3-2.1, we know that

$$f_{X|Y}(x|y) = \frac{f_{XY}(x, y)}{f_Y(y)},$$

where the joint pdf of  $X$  and  $Y$  are given as the following:

$$f_{XY}(x, y) = K \exp[-(x^2 + y^2 + 4xy)] \quad \text{all } x \text{ and } y$$

Now we can write

$$\begin{aligned} f_{X|Y}(x|y) &= \frac{f_{XY}(x, y)}{f_Y(y)} = \frac{K \exp[-(x^2 + y^2 + 4xy)]}{\int_{-\infty}^{\infty} f_{XY}(x, y) dx} \\ &= \frac{K \exp[-(x^2 + y^2 + 4xy)]}{\int_{-\infty}^{\infty} K \exp[-(x^2 + y^2 + 4xy)] dx} \\ &= \frac{\exp[-(x^2 + y^2 + 4xy)]}{\int_{-\infty}^{\infty} \exp[-(x^2 + y^2 + 4xy)] dx} \end{aligned}$$

Now, our focus is to find the best estimate for X as a function of the observation Y = y, the best estimate is found by equating the following derivative to zero:

$$\frac{df_{X|Y}(x|y)}{dx} = 0$$

which is equivalent to solve x in the following equation

$$\frac{d(\exp[-(x^2 + y^2 + 4xy)])}{dx} = 0$$

Since the denominator of  $\frac{f_{XY}(x,y)}{f_Y(y)}$  has no x terms (whatever the value it is after the integration).

Now our problem is simplified as finding the x in the following equation

$$\begin{aligned} \frac{d(\exp[-(x^2 + y^2 + 4xy)])}{dx} &= 0 \\ -(2x + 4y) \exp[-(x^2 + y^2 + 4xy)] &= 0 \end{aligned}$$

So, given the observation Y = y, we have the best estimate of x such that x satisfies  $2x + 4y = 0$ .

Or,

$$\hat{x} = -2y$$

So,  $\hat{x} = -2y$  is our best estimate of X given observation Y = y.

- b) Now if the observed value of Y is y=3, the best estimate of X is -6.

### 3-3.1

To see whether two random variables are statistically independent, we need to check if the following is true:

$$f_{XY}(x, y) = f_X(x)f_Y(y)$$

If two random variables are statistically independent, we can use the following to compute E[XY]:

$$E[XY] = E[X]E[Y]$$

- a)

$$f_{XY}(x, y) = \begin{cases} kx/y & 0 \leq x \leq 1, 1 \leq y \leq 2 \\ 0 & \text{elsewhere} \end{cases}$$

We use the following to find  $f_X(x)$  and  $f_Y(y)$ :

$$\begin{aligned} f_X(x) &= \int_{-\infty}^{\infty} f_{XY}(x, y) dy \\ f_Y(y) &= \int_{-\infty}^{\infty} f_{XY}(x, y) dx \end{aligned}$$

In this case

$$f_X(x) = \int_1^2 kx/y dy = \begin{cases} k \ln 2 \cdot x & 0 \leq x \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

Where  $k = \frac{2}{\ln 2}$ , if found by doing the following:

$$\int_{-\infty}^{\infty} f_X(x) dx = 1$$

So,

$$f_X(x) = \begin{cases} 2x & 0 \leq x \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

Similarly we find:

$$f_Y(y) = \begin{cases} \frac{1}{\ln 2 \cdot y} & 1 \leq y \leq 2 \\ 0 & \text{elsewhere} \end{cases}$$

Now, we know

$$f_{XY}(x, y) = \begin{cases} \frac{kx}{y} & 0 \leq x \leq 1, 1 \leq y \leq 2 \\ 0 & \text{elsewhere} \end{cases}$$

$$= \begin{cases} \frac{2x}{\ln 2 \cdot y} & 0 \leq x \leq 1, 1 \leq y \leq 2 \\ 0 & \text{elsewhere} \end{cases} = f_X(x)f_Y(y)$$

So, the two random variables X and Y are statistically independent and

$$E[XY] = E[X]E[Y] = \int_{-\infty}^{\infty} xf_X(x)dx \int_{-\infty}^{\infty} yf_Y(y)dy = \frac{2}{3\ln 2} = 0.9618$$

b) Following the same steps shown in part a), we find that

$$f_X(x) = \begin{cases} \frac{3}{2}x^2 + \frac{1}{2} & 0 \leq x \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_Y(y) = \begin{cases} \frac{3}{2}y^2 + \frac{1}{2} & 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_{XY}(x, y) = \begin{cases} \frac{3}{2}(x^2 + y^2) & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_{XY}(x, y) \neq f_X(x)f_Y(y)$$

So, X and Y are not statistically independent and

$$E[XY] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xyf_{XY}(x, y) dxdy = \int_0^1 \int_0^1 xy \frac{3}{2}(x^2 + y^2) dxdy = \frac{3}{8}$$

c) Following the same steps shown in part a), we find that

$$f_X(x) = \begin{cases} \frac{2}{7}(x + 3) & 0 \leq x \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_Y(y) = \begin{cases} \frac{2}{5}(y + 2) & 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_{XY}(x, y) = \begin{cases} \frac{4}{35}(xy + 2x + 3y + 6) & 0 \leq x \leq 1, 0 \leq y \leq 1 \\ 0 & \text{elsewhere} \end{cases}$$

$$f_{XY}(x, y) = f_X(x)f_Y(y)$$

So, X and Y are statistically independent and

$$E[XY] = E[X]E[Y] = \int_{-\infty}^{\infty} xf_X(x)dx \int_{-\infty}^{\infty} yf_Y(y)dy = 0.2794$$

### 3-3.3

Two independent r.v.s X and Y are both Gaussian distributed:

$$\bar{X} = 1, \quad \sigma_X^2 = 1$$

$$\bar{Y} = 2, \quad \sigma_Y^2 = 4$$

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma_X} = \exp\left[\frac{-(x - \bar{X})^2}{2\sigma_X^2}\right], \quad -\infty < x < \infty$$

$$f_Y(y) = \frac{1}{\sqrt{2\pi}\sigma_Y} = \exp\left[\frac{-(x - \bar{Y})^2}{2\sigma_Y^2}\right], \quad -\infty < y < \infty$$

$$f_X(x) = \frac{1}{\sqrt{2\pi}} = \exp\left[\frac{-(x - 1)^2}{2}\right], \quad -\infty < x < \infty$$

$$f_Y(y) = \frac{1}{2\sqrt{2\pi}} = \exp\left[\frac{-(y - 2)^2}{8}\right], \quad -\infty < y < \infty$$

Now

$$P\{XY > 0\} = P\{X > 0\}P\{Y > 0\} + P\{X < 0\}P\{Y < 0\}$$

$$P\{X > 0\} = \int_0^{\infty} f_X(x)dx = 1 - F_X(0) = 1 - P\{X \leq 0\}$$

$$P\{Y > 0\} = \int_0^{\infty} f_Y(y)dy = 1 - F_Y(0) = 1 - P\{Y \leq 0\}$$

So,

$$\begin{aligned} P\{X > 0\} &= 1 - F_X(0) = 1 - \left[1 - Q\left(\frac{x - \bar{X}}{\sigma_X}\right)\right] \\ &= Q(-1) \\ &= 1 - Q(1) \\ &= 1 - 0.1587 \\ &= 0.8413 \end{aligned}$$

$$\begin{aligned} P\{Y > 0\} &= 1 - F_Y(0) = 1 - \left[1 - Q\left(\frac{y - \bar{Y}}{\sigma_Y}\right)\right] \\ &= Q(-1) \\ &= 0.8413 \end{aligned}$$

$$P\{XY > 0\} = P\{X > 0\}P\{Y > 0\} + P\{X < 0\}P\{Y < 0\} = 0.8413^2 + 0.1587^2 = 0.7330$$
