Calculus

Derivatives:

$$\frac{d}{dx}x^n = nx^{n-1} \qquad \frac{d}{dx}\ln ax = \frac{1}{x} \qquad \frac{d}{dx}e^{ax} = ae^{ax}$$

$$\frac{d}{dx}\sin ax = a\cos ax \qquad \frac{d}{dx}\cos ax = -a\sin ax$$

Integrals:

$$\int x^n\,dx = \frac{x^{n+1}}{n+1} \quad (n \neq -1) \qquad \int \frac{dx}{x} = \ln x \qquad \int e^{ax}\,dx = \frac{1}{a}e^{ax}$$

$$\int \sin ax\,dx = -\frac{1}{a}\cos ax \qquad \int \cos ax\,dx = \frac{1}{a}\sin ax \qquad \int \frac{dx}{\sqrt{a^2 - x^2}} = \arcsin\frac{x}{a}$$

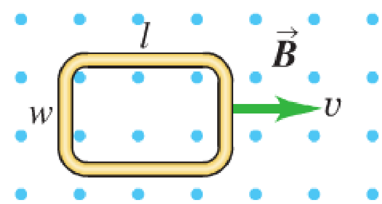
$$\int \frac{dx}{\sqrt{x^2 + a^2}} = \ln\left(x + \sqrt{x^2 + a^2}\right) \qquad \int \frac{dx}{x^2 + a^2} = \frac{1}{a}\arctan\frac{x}{a} \qquad \int \frac{dx}{(x^2 + a^2)^{3/2}} = \frac{1}{a^2}\frac{x}{\sqrt{x^2 + a^2}}$$

$$\int \frac{x\,dx}{(x^2 + a^2)^{3/2}} = -\frac{1}{\sqrt{x^2 + a^2}}$$

Physics 161-001 Spring 2012 Exam 4

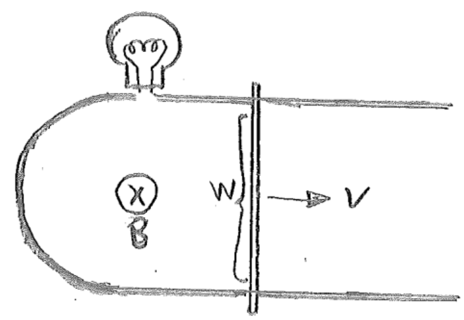
Name: ________________________________ Box#____________

1) A flat rectangular coil of dimensions l = 4.0m and w = 2.0m is pulled with uniform speed v = 2.0m/s through a uniform magnetic field B = 2.0T with the plane of its area perpendicular to the magnetic field as shown. The coil has a resistance of 10.0 Ω. What is the current induced in this coil?



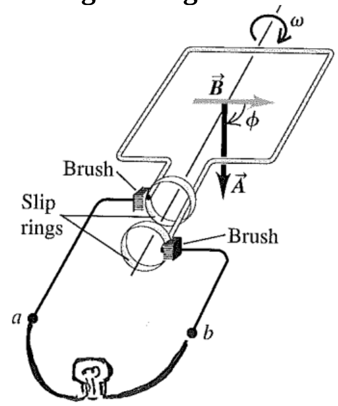
A) 1.6 A
B) 3.2 A
C) 8.0 A
D) 0.0 A
E) 4.0 A

2) A copper bar pulled with speed *v* along parallel copper tracks separated by a distance *w* in a uniform *B* field, into the page. What is the direction of the emf induced?



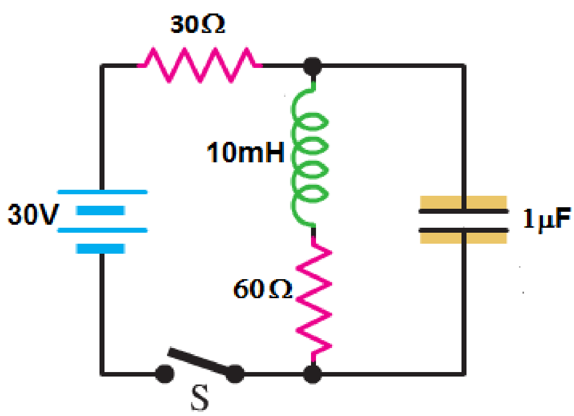
A) clockwise
B) counterclockwise
C) it depends on the sign of the charge carriers
D) there is no emf, because copper is not a magnetic metal like iron.

3) A rectangular coil is rotated at angular speed ω in a uniform horizontal B field, as shown. What is the position of the coil when the emf around the loop is clockwise (from above) and largest? (That is, when would maximum current flow from b to a through the light bulb?



A) in the orientation shown
B) 90° clockwise (loop vertical)
C) 180° flipped from what is shown
D) 270° clockwise from drawing
E) at an intermediate position

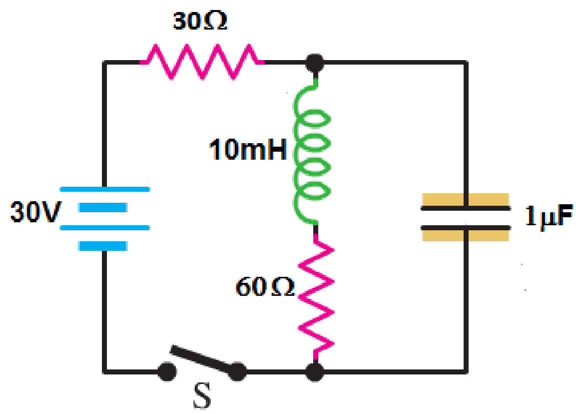
4) In the DC circuit shown, immediately after the switch is closed, what is the current through the capacitor?



A) 0
B) 1/3 A
C) 1 A
D) 106 A
E) 30 x 106 A
F) cannot determine

5) In the same circuit, what is the rate of change of the current through the inductor immediately after the switch is closed?
A) 0 A/s
B) 3 x 10^3 A/s
C) cannot determine
D) 3 x 104 A/s
E) 1 A/s

6) **A long time later (after the circuit has reached a steady state), the switch is opened. What happens in this circuit?**



A) all currents stop immediately
B) the current through the inductor decays gradually and monotonically
C) the current through the inductor oscillates without decay
D) the current through the inductor oscillates and gradually decays

7) In the previous problem, assuming that the damping factor is small enough to ignore, what is the approximate angular frequency of the subsequent oscillation, if any?

A) there is no oscillation
B) 10^{-8} rad/s
C) 6 krad/s
D) 60 x 10^{6} rad/s
E) 10^{4} rad/s

8) You are given a solenoid of length 1m and cross-sectional area of 0.01m^2. If you double the current through the solenoid, what happens to the self inductance of the solenoid?

A) Nothing.
B) It goes up by a factor of 2.
C) It goes up by a factor of 4.
D) It goes down by a factor of 2.
E) It goes down by a factor of 4.

9) In an LC circuit, with L = 10H and C = 1mF, the capacitor has an initial total energy stored in its electric field of 1mJ, and the inductor initially has no current through it. 157ms later, what is the total energy stored in the inductor?

A) 0J
B) 1mJ
C) -1mJ
D) 0.5mJ
E) -0.25mJ

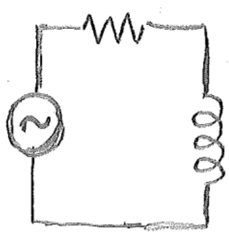
10) A capacitor is charging in a simple RC circuit with a dc battery. Which one of the following statements about this capacitor is accurate?

A) There is a magnetic field between the capacitor plates because charge travels between the plates by jumping from one plate to the other.
B) There is a magnetic field between the capacitor plates, even though no charge travels between them, because the magnetic flux between the plates is changing.
C) There is no magnetic field between the capacitor plates because no charge travels between the plates.
D) The magnetic field between the capacitor plates is increasing with time because the charge on the plates is increasing.
E) There is a magnetic field between the capacitor plates, even though no charge travels between them, because the electric flux between the plates is changing.

11) For a long ideal solenoid having a circular cross-section, the magnetic field strength within the solenoid is given by the equation B(t) = 2.0t T, where t is time in seconds. If the induced electric field outside the solenoid is 3.0 V/m at a distance of 3.0 m from the axis of the solenoid, find the radius of the solenoid.

A) 2.2m
B) 3.0m
C) 3.6m
D) 4.0m
E) 1.0m

12) In the AC circuit shown, the amplitude of the voltage across the inductor is 8 V; the amplitude of the voltage across the resistor is 6 V. What is the amplitude of the voltage provided by the source?



A) Cannot determine without R and L.
B) 2 V
C) 6 V
D) 8 V
E) 10 V

13) A magnet is perpendicular to a loop of copper wire with its N pole in the center. The magnet is pulled down, away from the loop. What is the direction of the induced EMF in the loop, as seen from above?

A) There is no induced EMF, since the wire is not moving and F=qvxB.
B) clockwise
C) counterclockwise
