Lecture 25 (Energy in Rotational Motion & Moments of Inertia)

Physics 160-01 Fall 2012 Douglas Fields

Review

Linear

– For const a:

$$x_f = x_i + v_i t + \frac{1}{2}at^2$$
$$v_f = v_i + at$$

– Kinetic energy:

$$KE = \frac{1}{2}Mv^2$$

Rotational

– For const α :

$$\theta_f = \theta_i + \omega_i t + \frac{1}{2} \alpha t^2$$

$$\omega_f = \omega_i + \alpha t$$

– Kinetic energy:

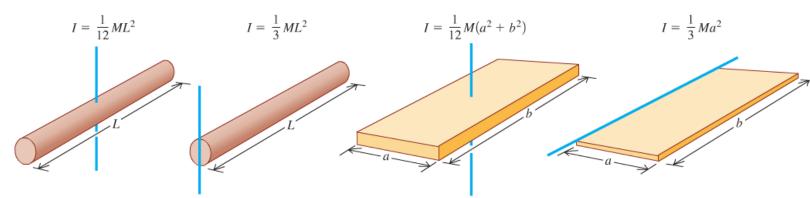

$$KE = \frac{1}{2}I\omega^2$$

Moments of Inertia

Table 9.2 Moments of Inertia of Various Bodies

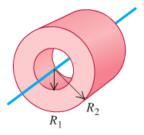

- (a) Slender rod, axis through center
- (b) Slender rod, axis through one end
- (c) Rectangular plate, axis through center

(d) Thin rectangular plate, axis along edge

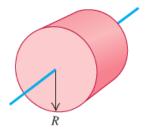

(e) Hollow cylinder

$$I = \frac{1}{2}M(R_1^2 + R_2^2)$$

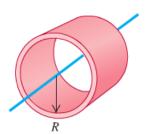

(f) Solid cylinder

$$I = \frac{1}{2}MR^2$$

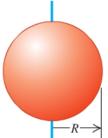

(g) Thin-walled hollow cylinder

$$I = MR^2$$

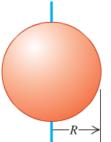

(h) Solid sphere

$$I = \frac{2}{5}MR^2$$

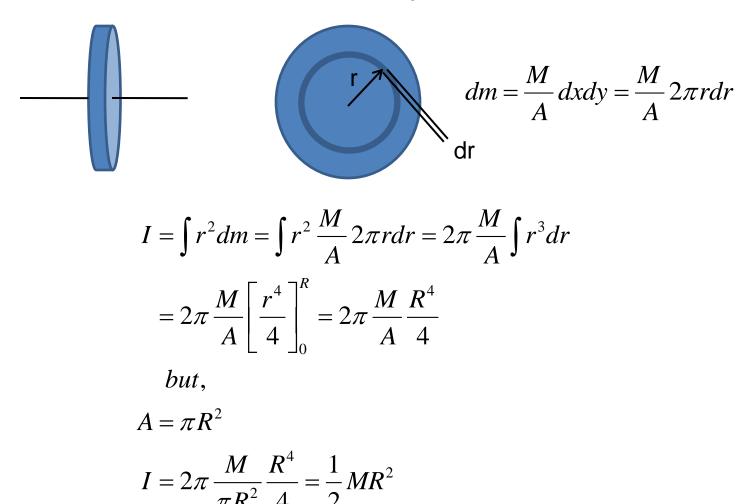

(i) Thin-walled hollow sphere

$$I = \frac{2}{3}MR^2$$

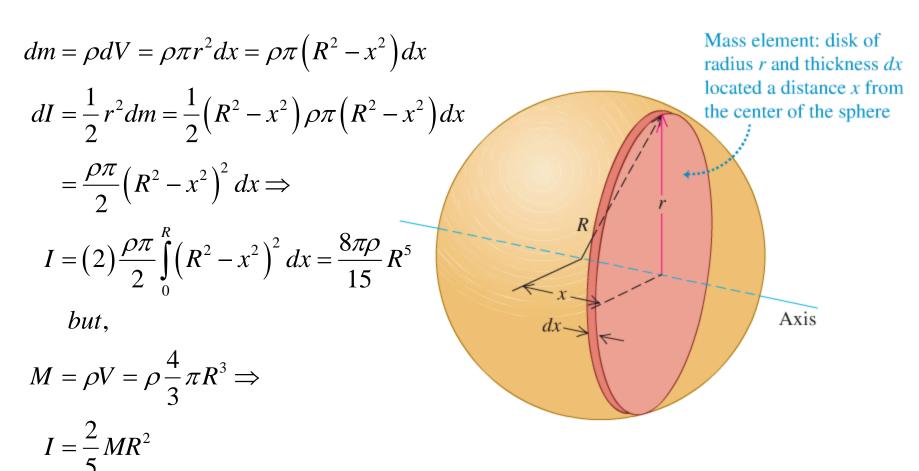

Example

Thin disk of uniform density (mass/unit area)

Example

Sphere of uniform density (mass/unit volume)

Parallel Axis Theorem

If we know the moment of inertia about an axis that passes through the center of mass of an object, then the moment of inertia about any axis parallel to that a distance d away is given by:

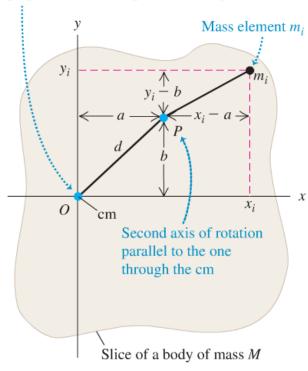

$$I_P = I_{cm} + Md^2$$

$$I_{cm} = \sum_{i} m_{i} \left(x_{i}^{2} + y_{i}^{2} \right)$$

$$I_{P} = \sum_{i} m_{i} \left[\left(x_{i} - a \right)^{2} + \left(y_{i} - b \right)^{2} \right]$$

$$= \sum_{i} m_{i} \left(x_{i}^{2} + y_{i}^{2} \right) - 2a \sum_{i} m_{i} x_{i} - 2b \sum_{i} m_{i} y_{i} + \left(a^{2} + b^{2} \right) \sum_{i} m_{i}$$
M

Axis of rotation passing through cm and perpendicular to the plane of the figure

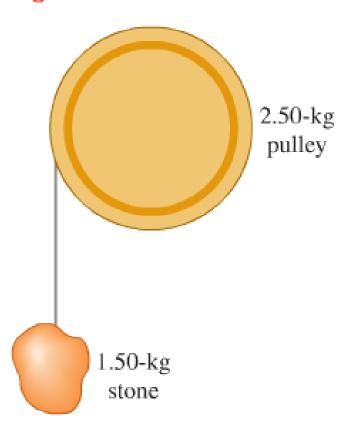

$$\sum_{i} m_{i} y_{i} + \left(a^{2} + b^{2}\right) \sum_{i} m_{i}^{d^{2}}$$

Problem 9.49

9.49. A frictionless pulley has the shape of a uniform solid disk of mass 2.50 kg and radius 20.0 cm. A 1.50-kg stone is attached to a very light wire that is wrapped around the rim of the pulley (Fig. 9.32), and the system is released from rest. (a) How far must the stone fall so that the pulley has 4.50 J of kinetic energy? (b) What percent of the total kinetic energy does the pulley have?

9.50. A bucket of mass m is tied

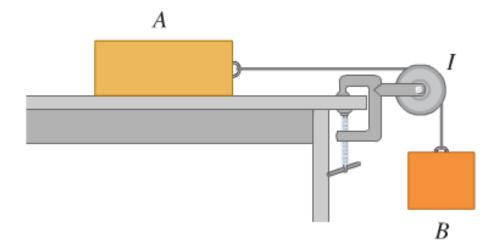

Figure 9.32 Exercise 9.49.

Problem 9.85

9.85. The pulley in Fig. 9.35 has radius R and a moment of inertia I. The rope does not slip over the pulley, and the pulley spins on a frictionless axle. The coefficient of kinetic friction between block A and the tabletop is μ_k . The system is released from rest, and block B descends. Block A has mass m_A and block B has mass m_B . Use energy methods to calculate the speed of block B as a function of the distance D that it has descended.

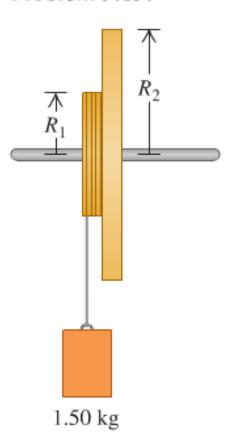

Figure **9.35** Problem 9.85.

Problem 9.89

9.89. Two metal disks, one with radius $R_1 = 2.50$ cm and mass $M_1 = 0.80$ kg and the other with radius $R_2 = 5.00$ cm and mass $M_2 = 1.60 \,\mathrm{kg}$, are welded together and mounted on a frictionless axis through their common center (Fig. 9.37). (a) What is the total moment of inertia of the two disks? (b) A light string is wrapped around the edge of the smaller disk, and a 1.50-kg block is suspended from the free end of the string. If the block is released from rest at a distance of 2.00 m above the floor, what is its speed just before it strikes the floor? (c) Repeat the calculation of part (b), this time with the string wrapped around the edge of the larger disk. In which case is the

Figure **9.37** Problem 9.89.

final speed of the block the greatest? Explain why this is so.
